

PACK-MAID® Bruno Tool

This new tool will change the way you maintain Pump & Valve stem packing

Why the Bruno instead of another tool? The Bruno was designed by a pump and valve mechanic working in a nuclear power plant. He had the same problems as you have every day. We understand that you need a special tool sometimes and not just a plain vanilla all-purpose tool. This tool or set of tools will allow you to remove packing more efficiently than any other tool in the market today! Finally, a packing extractor with the proper design to get you into the most difficult areas.

How to handle: The grooves on the handle lined up so that you get the maximum leverage from your wrist and thumb. The complex angles of the tool will help give proper penetration around the shaft and into the packing. These special tools are made of high carbon, heat treated steel.

The 15° angle allows access to the packing around the shaft, packing can be removed easily.

The 30° Angel allows you to get around the shaft and keep the point from damaging the stuffing box

Result: the set point will help reduce scratching or damaging the shaft or sleeve. A damaged shaft, stem, or sleeve can accelerate leakage.
